2

A Problem in the Making

White cloud at the combustion air intake of a boiler on a common flue with other boilers =

- Condensing flue gas inside
- Carbonic acid
- Corrosion
 - Heat transfer surfaces
 - Combustion air system
 - Combustion air fan
 - Controls
 - Casing

5/5/2005

P | E | C | C | I

3

A Problem in the Making

**Major Damage to
8 Boilers During
Temporary Operation!**

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | C | I

4

How Could This Happen?

- Commissioning Included From Early Design Phases
- Major Construction
- Experienced Design and Construction Team
- Owner Heavily Involved in Construction
- Problem Identified Early
- Problem Discussed Frequently
- Potential for Damage Acknowledged By All

- My answer:

*I don't really know, but
"sometimes the magic works
and sometimes, it does not".*

5/5/2005

P | E | C | I

5

This Begs the Question:

**What Makes the
Magic Work?**

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

6

Starting Early Helps the Magic Work

The Owners intent to provide a high quality internal environment leads the commissioning provider to ask a question during a design review meeting:

Do we really need to humidify in Seattle?

Hmmmm, lets think about that for a minute

5/5/2005
© 2005 PECCI. Do not reproduce without permission

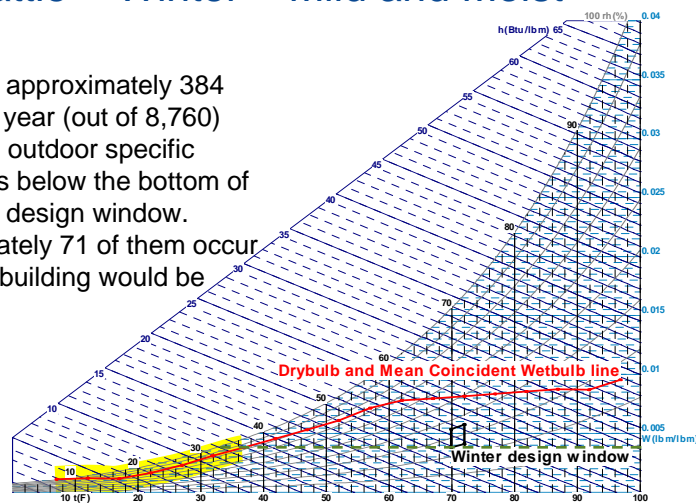

PECCI

7

Seattle + Winter = Mild and Moist

There are approximately 384 hours per year (out of 8,760) where the outdoor specific humidity is below the bottom of the space design window. Approximately 71 of them occur when the building would be operating.

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

8

Looking Humidification in the Bigger Picture

- **Lost**
 - Absolute assurance that indoor humidity will not be below 25 - 30% for 70-100 hours per year
- **Gained**
 - \$100,000 savings in first cost
 - \$6,000 savings in annual operating cost

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

9

What Made the Magic Work?

Technical Stuff

- Being aware of the environment
- Commissioning

Non-Technical Stuff

- Thinking outside the box
- Flexibility

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

10

Does Fixed in Design Mean its Fixed?

Design review identified critical

100% Outdoor air AHU design issues:

- Desirability of maximum face area
- Need for access
- Need for space for freeze stat
- Preheat vs. warm up issues

... and the construction drawings reflected these comments

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

11

The Shop Drawing Reflects a Problem

Note the lack of space between the coils!

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

12

Shop Drawing Mark-ups

- Note coil problem and other issues
- “Approved as Noted” to maintain schedule

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

13

The Equipment Arrives on Site ...

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

14

... and a Problem Arrives With It

Coil connections match the uncorrected shop drawings, not the construction drawings

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

15

The Issues

- Freezing Issues
 - Equipment failures
 - Climate extremes
- Access issues
 - Maintenance
 - Sensor installation
- Operational issues
 - Potential nuisance shut downs
 - Draining the coil

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

16

The Good News

- The problem was solved with out major modification or expense via:
 - Focusing on solving the problem rather than assessing blame
 - Flexibility on the part of the Owner, Designer, and Contractors
 - Thinking “outside the box”

5/5/2005

© 2005 PECCI. Do not reproduce without permission

PECCI

17

The Solution

- Use a feed-forward control strategy to operate the preheat valve based on entering conditions rather than leaving conditions
- The chilled water coil backs up an evaporative cooling process, so keep the coil drained
- Start-up and continuous commissioning to make sure it all works

5/5/2005

© 2005 PECCI. Do not reproduce without permission

PECCI

18

What Made the Magic Work?

Technical Stuff

- Being aware of the environment
- Commissioning II
- Technology

Non-Technical Stuff

- Thinking outside the box
- Flexibility II

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

19

Making the Magic Work Requires Attention on Many Commissioning Fronts

Out of sight, out of mind in the Midwest

- 100 kW of electric snow melt installed at the new Emergency Room entrance
- No energy management system tie-in

Design phase Cx lapse

Images courtesy www.memhosp.com and www.squared.com.

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

20

Making the Magic Work Requires Attention on Many Commissioning Fronts

Images courtesy www.memhoop.com and www.squared.com.

The commissioning process

- Turned on during a snow storm
- Success – No snow or ice at the ER entrance!
- Forgot to turn it off after the storm

Construction phase Cx lapse

- No utility bill tracking program

Ongoing Cx lapse

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

21

Making the Magic Work Requires Attention on Many Commissioning Fronts

Images courtesy www.memhoop.com and www.squared.com.

Long term results

- No snow or ice at the ER entrance all winter
- Dry sidewalks after a thunderstorm in July

Ongoing Cx insight

- 2,400 kWh per day for months!

Cash flow lapse

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

22

The Solution

- Turn off the snow melt in the summer
- Add a pilot light to the contactor
- Be more aware of what's going on

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

23

What Made the Magic Work?

Technical Stuff

- Being aware of the environment
- Commissioning III
- Technology II

Non-Technical Stuff

- Thinking outside the box
- Flexibility II
- Taking action

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

24

Making the Magic Work Requires Training

- Owner requirement
 - AHU starters have “Test” – “Off” – “Auto” switches
 - Safeties (including the freeze-stat) overridden in the “Test” position for troubleshooting purposes

Images courtesy www.eatonlectrical.com.

5/5/2005

© 2005 PECCI. Do not reproduce without permission

P | E | C | I

25

Making the Magic Work Requires Training

- Engineer's push-back
 - Prefer no safety overrides
 - If non-negotiable, then spring return from test

Images courtesy www.eatonlectrical.com.

5/5/2005

© 2005 PECCI. Do not reproduce without permission

P | E | C | I

26

Making the Magic Work Requires Training

- The result
 - Frozen coil
- The reason
 - Lack of training on spring return feature
 - A crescent wrench clamped to the switch tang holding the switch in the test position

Images courtesy www.eatonlectrical.com

5/5/2005

© 2005 PECCI. Do not reproduce without permission

P | E | C | I

27

The Solution

- Train the operators
- Re-think compromise on critical issues

5/5/2005

© 2005 PECCI. Do not reproduce without permission

P | E | C | I

28

What Made the Magic Work?

Technical Stuff

- Being aware of the environment
- Commissioning III
- Technology II

Non-Technical Stuff

- Thinking outside the box
- Flexibility II
- Taking action

5/5/2005

P | E | C | I

29

What Made ^{or would have made} the Magic Work?

Technical Stuff

- Being aware of the environment
- Commissioning III
- Technology II

Non-Technical Stuff

- Thinking outside the box
- Flexibility II
- Taking action
- Courage of convictions

Magic Worked

III

Magic Didn't Work

II

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

30

Knowledge Makes the Magic Work

- Mid-1980's vintage Midwest high rise (13 floors)
- Engineered smoke control cycle
 - Shuts down and isolates some units
 - Runs others to pressurize or exhaust fire floor
- Control system addresses smoke damper interlocks
 - Analog discharge static limit control
 - Limit switches

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

31

Test Results – Initial Engineered Smoke Cycle Functional Test

- Smoke damper closure triggered by fire alarm. ☒
- Fan shutdown triggered by smoke damper limit switch. ☒
- Smoke dampers close in less than 1 minute (5 seconds). ☒
- Duct is leak free. ☒
- Duct pressure rating is good. ☒
 - Ray Baltimore (control fitter) notes that the duct pressure gauge indicated 6 inches w.c. before we heard the bang; duct pressure class is 4 inches w.c.

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

32

Control System Design Didn't Address:

Pneumatic actuator speed

- The control designer probably should have thought of this
- (The control designer was me)

Air hammer

- The control designer never heard of this until Tom (graciously) said "WE must have air hammered the duct!"

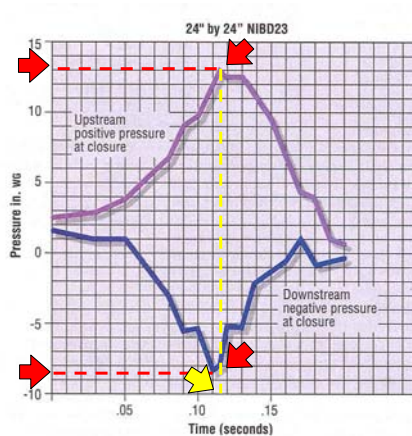

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

33

Control System Design Didn't Address:

Images courtesy Ruskin's catalog

Air hammer

- The control designer never heard of this until Tom (graciously) said "WE must have air hammered the duct!"

See the FT Guide supplemental information for Chapter 13 – Distribution to learn more about air hammer and how to prevent it

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

34

The Solution

- Train the control designer/commissioning technician about air hammer (beyond having him blow the duct apart).
- Add restrictor tees to the bleed ports of the solenoids serving the actuators to slow them down on the close stroke.
- Zip screws
- Angle iron

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

35

P | E | C | I

36

Lesson's Learned Make the Magic Work (Although some take a while to sink in)

- Mid-1980's vintage Midwest low-rise (6 floors)
- Combination fire/smoke dampers isolate return ceiling from return shaft on fire alarm
- Control system addresses the potential for problems
 - Restrictors installed on the pneumatic actuators
 - Field personnel trained
 - Return static limit switches contemplated
 - Eliminated due to budget
 - *"What could go wrong on the return side with the actuators slowed down, right?"*

Photo is not of the actual damper but of a similar arrangement but with an electric actuator

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

37

A Little Pressure Over A Lot of Area is What Can Go Wrong

- Air supplied to the dampers to hold them open for temporary AHU operation
- Fire alarm installation in progress
 - Fire alarm not powered up
 - Fire alarm relays energize solenoids to open dampers
 - Solenoid tubing connections temporarily reversed so non-energized solenoids hold dampers open
 - Condition placarded and discussed at job meeting

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

38

Test Results – Fire Alarm Panel Power-On Test

- Fire alarm panel inadvertently energized. ✓
- Return shaft smoke dampers start to slowly close. ✓
- Commissioning tech and control fitter on 3rd floor note “whooshing” sound. ✓
- Ceiling tiles begin to drop from the grid around the return shaft as the shaft wall deflects. ✓
- Commissioning tech and control fitter on 3rd floor put two and two together. ✓
- Commissioning tech and control fitter exchange brief remarks about the situation. ✓
- Control fitter makes mad dash to rooftop mechanical room and pulls disconnects on the air handling systems, averting disaster. ✓
- Commissioning tech buys control fitter a 6 pack. ✓
- Commissioning tech gets permission to purchase static limit switches. ✓

PECCI

40

Magic May Not Work if Things Are Cast in Concrete (But it may keep them from becoming that way!)

- Northwest Regional Training Facility and Warehouse
 - LEED Gold
 - Radiant slab heating
 - Turn-key project
 - Aggressive construction schedule
- Contractor concerned about radiant slab pour
 - Tubing located to miss future floor penetrations
 - Tubing supported to prevent damage during pour
 - Plan of action to detect and repair damage during the pour
 - Plan of action to document tubing installation before the pour

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

41

Contractor Requests Cx Support on the Morning of the Concrete Pour

Contractor responsibilities

- Tubing installed
- Concrete ordered and on the way
- Worry

Cx verification checks

- Tubing layout matches plans
- Tubing layout documented
- Tubing installed per manufacturers recommendations
- Plan of action to detect and repair leaks in place
- **Perimeter insulation in place**

5/5/2005
© 2005 PECCI. Do not reproduce without permission

P | E | C | I

42

Solution

- Send concrete trucks back
- Continue to breath normally
- Install insulation

5/5/2005
© 2005 PECCI. Do not reproduce without permission

PECCI

51

Design and Construction Phase
Commissioning...

**Part of the Magic that Solves
or Prevents Problems...**

**... and, it Works More Often
Than Not!**

5/5/2005

© 2005 PECCI. Do not reproduce without permission

PECCI

52

But, Its More than Just Saying You're Doing It

Technical Skills are Essential

- Familiarity with Commissioning
- Knowledge of the Fundamentals
- Familiarity with the Technology
- Being aware of the Environment

Other Skills Can Be Extremely Useful

- Thinking outside the box
- Flexibility
- Being Proactive
- Trusting Yourself
- Optimism
- Leadership and Enthusiasm

... and being open to good fortune can't hurt!

5/5/2005

54

NATIONAL CONFERENCE ON
BUILDING COMMISSIONING

Session 23 – New Commissioning Tools from a Collaborative Research Project

What is the Functional Testing Guide and How are We Enhancing It?

David Sellers

Senior Engineer, Technical Manager

PECI

Origins of the Functional Testing Guide

- Research and Development Project
 - California Energy Commission's Public Interest Energy Research Program (PIER)
 - U.S. Department of Energy
 - Lawrence Berkeley National Laboratory's High Performance Commercial Building Systems
- Original Goal
 - Compile a library of functional tests
 - Identify the gaps

5/6/2005
© 2005 PECI. Do not reproduce without permission

2

Origins of the Functional Testing Guide

- **Research and Development Project**
 - California Energy Commission's Public Interest Energy Research Program (PIER)
 - U.S. Department of Energy
 - Lawrence Berkeley National Laboratory's High Performance Commercial Building Systems
- **PG&E's Commissioning Test Protocol Library**
 - Focused on a similar goal
 - Reviewed 400+ functional tests
 - Compiled a library of publicly available tests
 - Not all testing requirements fully covered
 - Missing theory behind the tests

5/6/2005
© 2005 PECC. Do not reproduce without permission

3

Origins of the Functional Testing Guide

- **Research and Development Project**
 - California Energy Commission's Public Interest Energy Research Program (PIER)
 - U.S. Department of Energy
 - Lawrence Berkeley National Laboratory's High Performance Commercial Building Systems
- **NCBC 2000 Round Table Discussion**
 - Should the project be re-focused?
 - What should the new focus be?

5/6/2005
© 2005 PECC. Do not reproduce without permission

4

Origins of the Functional Testing Guide

- Research and Development Project
 - California Energy Commission's Public Interest Energy Research Program (PIER)
 - U.S. Department of Energy
 - Lawrence Berkeley National Laboratory's High Performance Commercial Building Systems
- Revised Goal
 - Complement the CTPL with a testing guideline
 - CTPL says how to test
 - FTG says why
 - Base on fundamentals
 - User adapts as needed
 - Provide cost benefit information
 - Begin to fill CTPL gaps
 - Provide a development framework

5/6/2005
© 2005 PECT. Do not reproduce without permission

5

Released at NCBC 2003

- CD's
 - NCBC
 - PG&E training classes
- Download from:
 - <http://buildings.lbl.gov/hpcbs/FTG>
- Judging user acceptance
 - Feedback form at download
 - Word of mouth
 - LBNL survey

6

5/6/2005
© 2005 PECL. Do not reproduce without permission

7

Enter, stage right: the STAC* Project

- Project Goal – Enhance the FT Guide based on user feedback
 - Develop the *Integrated Control and Operation* Chapter
 - Expand the Guide
 - Pumping Systems
 - Chiller/Condenser Systems
 - Boiler Systems
- Project Goal - Address barriers to the widespread uptake of Cx
 - Enhance the FT Guide
 - Add tests to the FT Guide
 - Provide Cx and RCx training
 - Develop/deploy a functional test checklist tool

*State Technologies Advancement Collaborative

5/6/2005
© 2005 PECL. Do not reproduce without permission

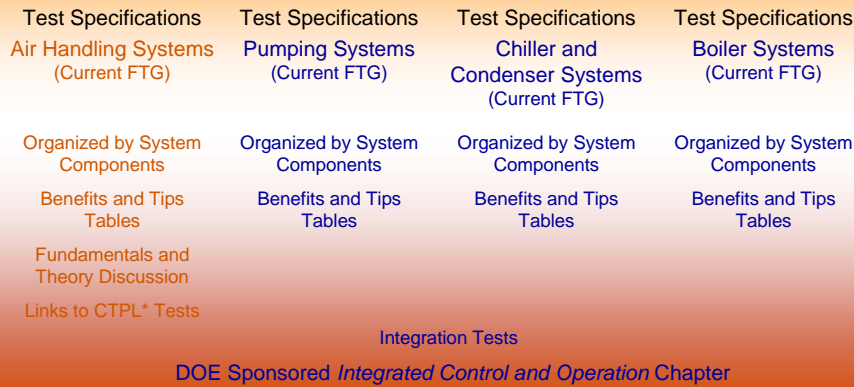

8

Parallel FT Guide Development Paths, Comprehensive FT Guide Structure

STAC Sponsored *Functional Testing Basics* and *How to Write and Develop a Test Chapter*

STAC Sponsored Tools and RCx and Cx Training Based on the FT Guide

*PG&E's Commissioning Test Protocol Library

5/6/2005
© 2005 PECL. Do not reproduce without permission

15

Content Organization

- How to Use the Guide Chapter
 - Navigation
 - Commissioning process
- Introduction to Functional Testing
 - System concept
 - Elements common to all functional tests
- Individual component chapters
 - Move through AHU from inlet to exhaust
 - Integration issues

5/6/2005
© 2005 PECL. Do not reproduce without permission

16

A Work in Progress

- Not all chapters fully developed in the first release
 - All chapters contain basic information
 - Testing benefits table
 - Testing field tips table
 - Some included supplemental information
 - Design related issues
 - Theory and details
 - Some include proposed development path

5/6/2005
© 2005 PECL. Do not reproduce without permission

17

Using the FT Guide for Design Phase Cx

A successful test has its foundation in a good design

5/6/2005
© 2005 PECL. Do not reproduce without permission

18

Reviewing the Design

Integrating design intent with operating reality

- Non-design conditions
- Non-steady state issues
- Operation and maintenance issues

5/6/2005
© 2005 PECI. Do not reproduce without permission

19

Planning the Test

- Developing a commissioning plan
- Developing specifications
- Developing sample tests and first drafts
- Identifying additional design issues

5/6/2005
© 2005 PECI. Do not reproduce without permission

20

Using the FT Guide for Construction Phase Cx

Proper design execution the key to success.

"Shhhh, Zag! ... Here come one now!"

5/6/2005
© 2005 PECL. Do not reproduce without permission

21

Reviewing shop drawings

Integrating design intent with operating reality

- Actual configuration vs. specified
- Actual performance vs. specified
- Actual accessories vs. specified
- Fixing things on paper is more cost effective than fixing them with a cutting torch

5/6/2005
© 2005 PECL. Do not reproduce without permission

22

Monitoring Construction

Setting things up for success from the start

- Proper assembly
- Proper field application
- Accessibility for maintenance and inspection

5/6/2005
© 2005 PECC. Do not reproduce without permission

23

Verifying Integrated Construction

Bringing the integration perspective to construction observation

- Assessing the installation of assemblies involving multiple trades and disciplines
- Verifying things that are hidden by subsequent construction

Planning the Test

Identifying potential weak spots and/or critical performance issues

- Potential field improvements prior to testing
- Future testing and verification targets

Using the FT Guide to Develop a Test

System manual discrepancy

- Economizer change over by comparison to return air temperature vs.
- Economizer change over based on outdoor air temperature

Section 1: Air Handling Unit AHU-1 & Exhaust Fans EF-7&8

DESCRIPTION:
Air handling unit (AHU-1) is a central station, single zone, unit.

When the outside air temperature is greater than the return air temperature the cooling coil chilled water control valve (TCV-1) shall modulate as required to maintain the supply air temperature at set point and the economizer dampers shall be positioned to provide the minimum design outside air CFM. The exhaust fans EF-7&8 shall be programmed "off."

The supply air static pressure transducer (SPS-1), located in the 18" x 36" duct below VAV unit 2-1 in the return duct between columns 1-4 and 1-6 (above the ceiling of the green room), operating from PCM-1, modulates the supply air to the return VAV controller as required to maintain the duct static pressure at set point.

The VAV unit with the greatest airflow demand (VAV damper-90% open) resets the duct static pressure set point between 1" w.g. and 2" w.g. as required to deliver the quantity (CFM) of supply air needed to maintain the room temperature set point.

The VAV unit with the greatest cooling demand (VAV airflow set point-90% design maximum airflow set point) resets the supply air temperature set point between 55°F and 59°F as required to deliver temperature of supply air needed to maintain the room temperature set point.

OPERATING CONTROL SETPOINTS:
Building static pressure: 0.03" to 0.07" w.g. (DPX-1) Economizer Operating Mode only. No set point control for min outside air operating mode.
Supply Air Duct Static Pressure: 1.0" - 2.0" w.g. (DPX-2) Reset by Greatest Airflow Demand (reset open VAV damper).
Supply Air Temperature: 55°F - 68°F (TS-1) Reset by Greatest Cooling Demand.
Outside Air Temperature: (TS-1) >72°F Economizer Operating Mode. <72°F Minimum Outside Air Operating Mode.
Temperature Control Valve (TCV-1) AHU-1 Supply Fan "off". Full Reheat Position, Fan "on" - modulating control.
Filter (Dry) (Differential Pressure: 1.0 w.g. (DPX-3).

ALARM SETPOINTS:

	NORMAL RANGE	TRIP	RETURN	TYPE
Supply Fan Failure (SPF switch)	digital	0.001 to 0.01	0.000 to 0.001	failure*
High Low Building Static Pressure (DPX-1)	0.025" w.g.	0.001 to 0.01	0.000 to 0.001	enable
High Low Duct Static Pressure (DPX-2)	0.025" w.g.	0.001 to 0.01	0.000 to 0.001	enable

Supply Air Temperature Set Point*
Supply Air Temperature: 55°F - 68°F (TS-1) Reset by Greatest Cooling Demand.

Outside Air Temperature: (TS-1) <72°F Economizer Operating Mode. >72°F Minimum Outside Air Operating Mode.

How the Guide Might Help

- Understand economizer theory
 - General operating theory
 - Related parameters like minimum outdoor air and building pressurization
 - Typical components
 - Control strategies
 - Typical problems

28

How the Guide Might Help

- Provide a test template
 - Start with an existing CTPL test
 - Development options
 - Use the existing test on the fly
 - Quickly modify the existing test
 - Modify and format to your “look”
 - Use trending

Fan Energy: A Function of Head and Flow

$$P_{Fan} = \frac{Q \times SP}{K \times \eta_{Fan} \times \eta_{Motor} \times \eta_{Drive}}$$

Where :

P_{Fan} = Horsepower into the motor serving the fan

Q = Flow rate in cubic feet per minute

SP = Static pressure in inches water column

K = Units conversion constant = 6,356

η_{Fan} = Fan static efficiency

η_{Motor} = Motor efficiency

η_{Drive} = Drive efficiency
